**Please follow these steps completely before trying to run automation on Safari.**
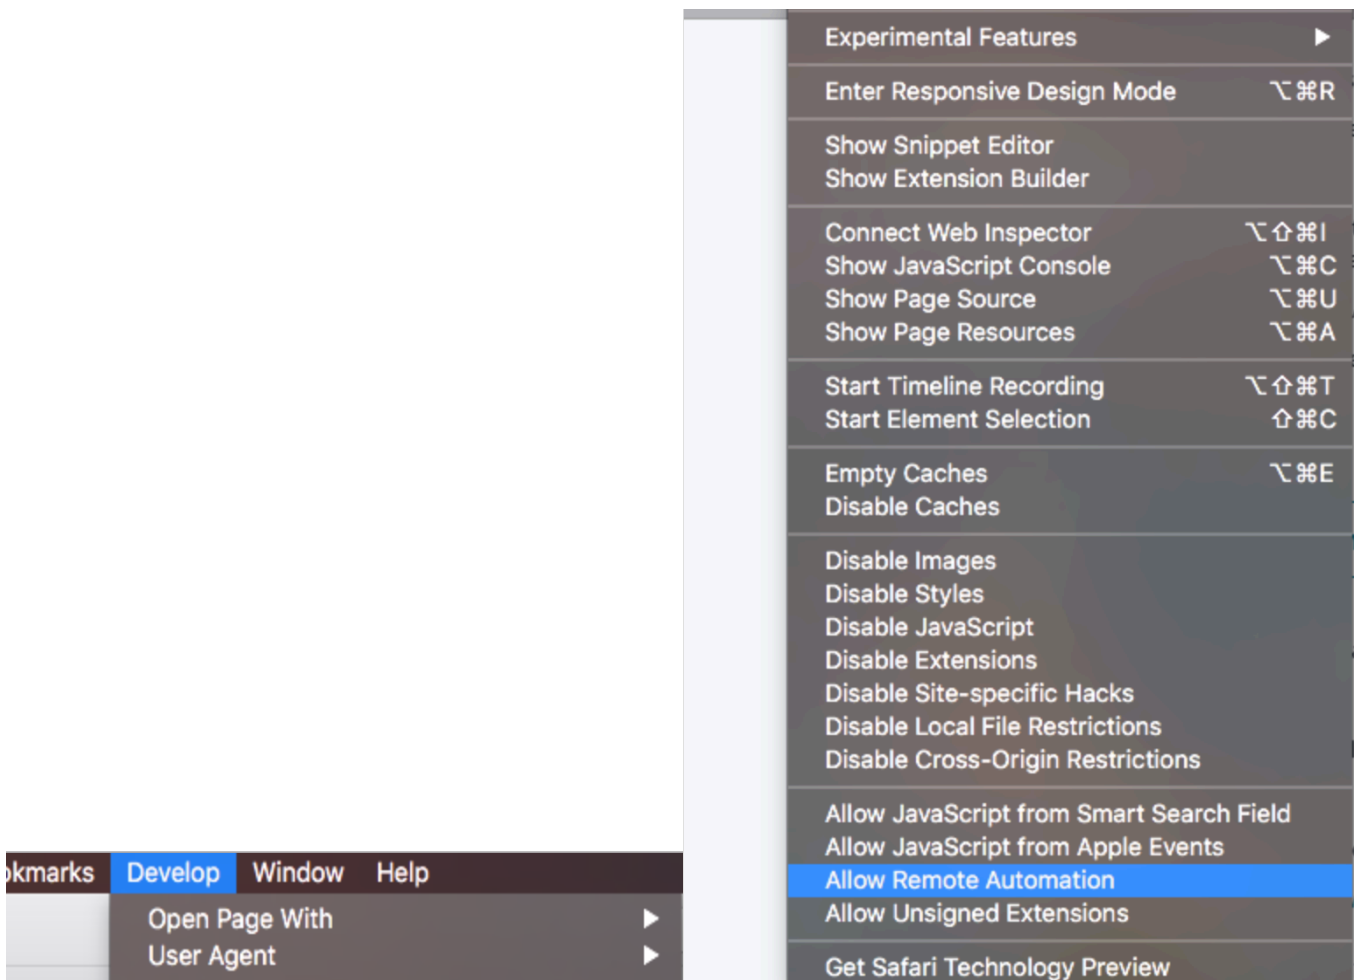

Important thing to notice: Safari Automation is only possible on Mac; Apple and Selenium WebDriver Automation do not support it on Windows

If you have a Mac system, please do these steps: If you have a Windows system you can skip Safari lecture.

1. Download the "Selenium Standalone Server" file from http://www.seleniumhq.org/download/
2. Right click and open the file, confirm by clicking Open button, please see the screenshot.

3. Open Safari, follow this link to show the Develop menu:
http://osxdaily.com/2011/11/03/enable-the-develop-menu-in-safari/

4. Click on Develop menu -> Select -> Allow Remote Automation

In the lecture, I have talked about downloading the extension. You can skip that part as it is not needed after Selenium WebDriver 3.x version.

Above steps followed are complete and the code will remain the same. There are no changes from the code perspective.
